2014 JBE Pickups™

This diagram is a logical wiring representation. Various physical implementations are possible if shielded cavities are not present. Always have all ground connections connected in the same ground plane as the jack ground to avoid noise and hum noise

Leave red/white wires tied together without connection in the control cavity. These wires may be separated and connected later to PP pots or other switches for optional parallel wirings if desired. Parallel wiring not shown

EXERCISE GOOD INSTALLATION PRACTICE
 Never over-tighten the pickups' mounting screws. Over-tightening can cause separation of the pickup's mounting plate. DO NOT USE AN ELECTRIC DRILL DRIVER

* all wiring: Green/Bare can wire to top of a pot for ground connection.

Keep bare wires from contacting + signal areas
 Combine Green and Bare wires and. Wrap with heatshrink

Control, switch, and pickup cavities should be in the same ground plane
